CT CHEST WITHOUT CONTRAST, 07/14/2006 -

CLINICAL HISTORY - LEFT LUNG LESION.

TECHNIQUE - Axial images obtained through the chest, 2 mm x 2 mm.  
Noncontrast. Coronal reformats.

FINDINGS -

LEFT LUNG - Left upper lobe has perihilar and paraseptal emphysema,  
mild. No left lower lobe lesions.

Lingula - No lingular lesions.

Left Lower Lobe - Perihilar and paraseptal emphysema again noted. No  
left lower lobe lesions.

RIGHT LUNG -

Right Upper Lobe - No nodules or masses.

Right middle lobe - No nodules or masses.

Right Lower Lobe - Mild right perihilar and paraseptal emphysema. No  
nodules or masses. No pleural fluid.

Mediastinum - Aortic arch calcifications are present. No mediastinal  
adenopathy. No evidence for heart enlargement.

Limited evaluation of the upper abdomen shows the adrenal glands to be  
symmetric in appearance. There is a 2 cm likely conglomeration of celiac  
lymph nodes, nonspecific. Punctate calcifications in the left lobe of  
the liver are nonspecific and may relate to prior trauma and infection.

There is 1 cm right axillary lymph node. Shotty left axillary lymph  
nodes.

September 7, 2006

To whom it may concern,

This is to certify that I am the attending physician for Kevin Cash since 1991. Kevin has emphysema secondary to smoking and also has a history of positive PPD. In addition, he has had long history of smoking.

His wife relates to me that he has been more short of breath recently. He had a recent chest CT scan done on 7/14/06 which showed emphysema and aortic calcification. I would recommend that a chest xray and echocardiogram be done to rule out cardiac causes.

Sincerely,

Anthony Magliulo M.D.
